Disclaimer

- **We disclaim any warranties or representations as to the accuracy or completeness of this material.**
- **Materials are provided “as is” without warranty of any kind, either express or implied, including without limitation, warranties of merchantability, fitness for a particular purpose, and non-infringement.**
- **Under no circumstances shall we be liable for any loss, damage, liability or expense incurred or suffered which is claimed to have resulted from use of this material.**

Goal

- The lecture aims at introducing the concept of **System** from a hierarchical perspective
- The concept of **Processing Element (PE)** is then introduced
- Each PE is then presented in terms of **DataPath & Control Unit**
- An extensive presentation of the most widely used taxonomies for digital systems concludes the lecture.

Prerequisites

– **None**

Homework

– None

Further readings

- Students interested in making a reference to a text book on the arguments covered in this lecture can refer, for instance, to:
 - *G. Conte, A. Mazzeo, N. Mazzocca, P. Prinetto: “Architettura dei calcolatori”, Città Studi, 2015 (Chapter 1: Classificazioni e Concetti base) (In Italian)*

System

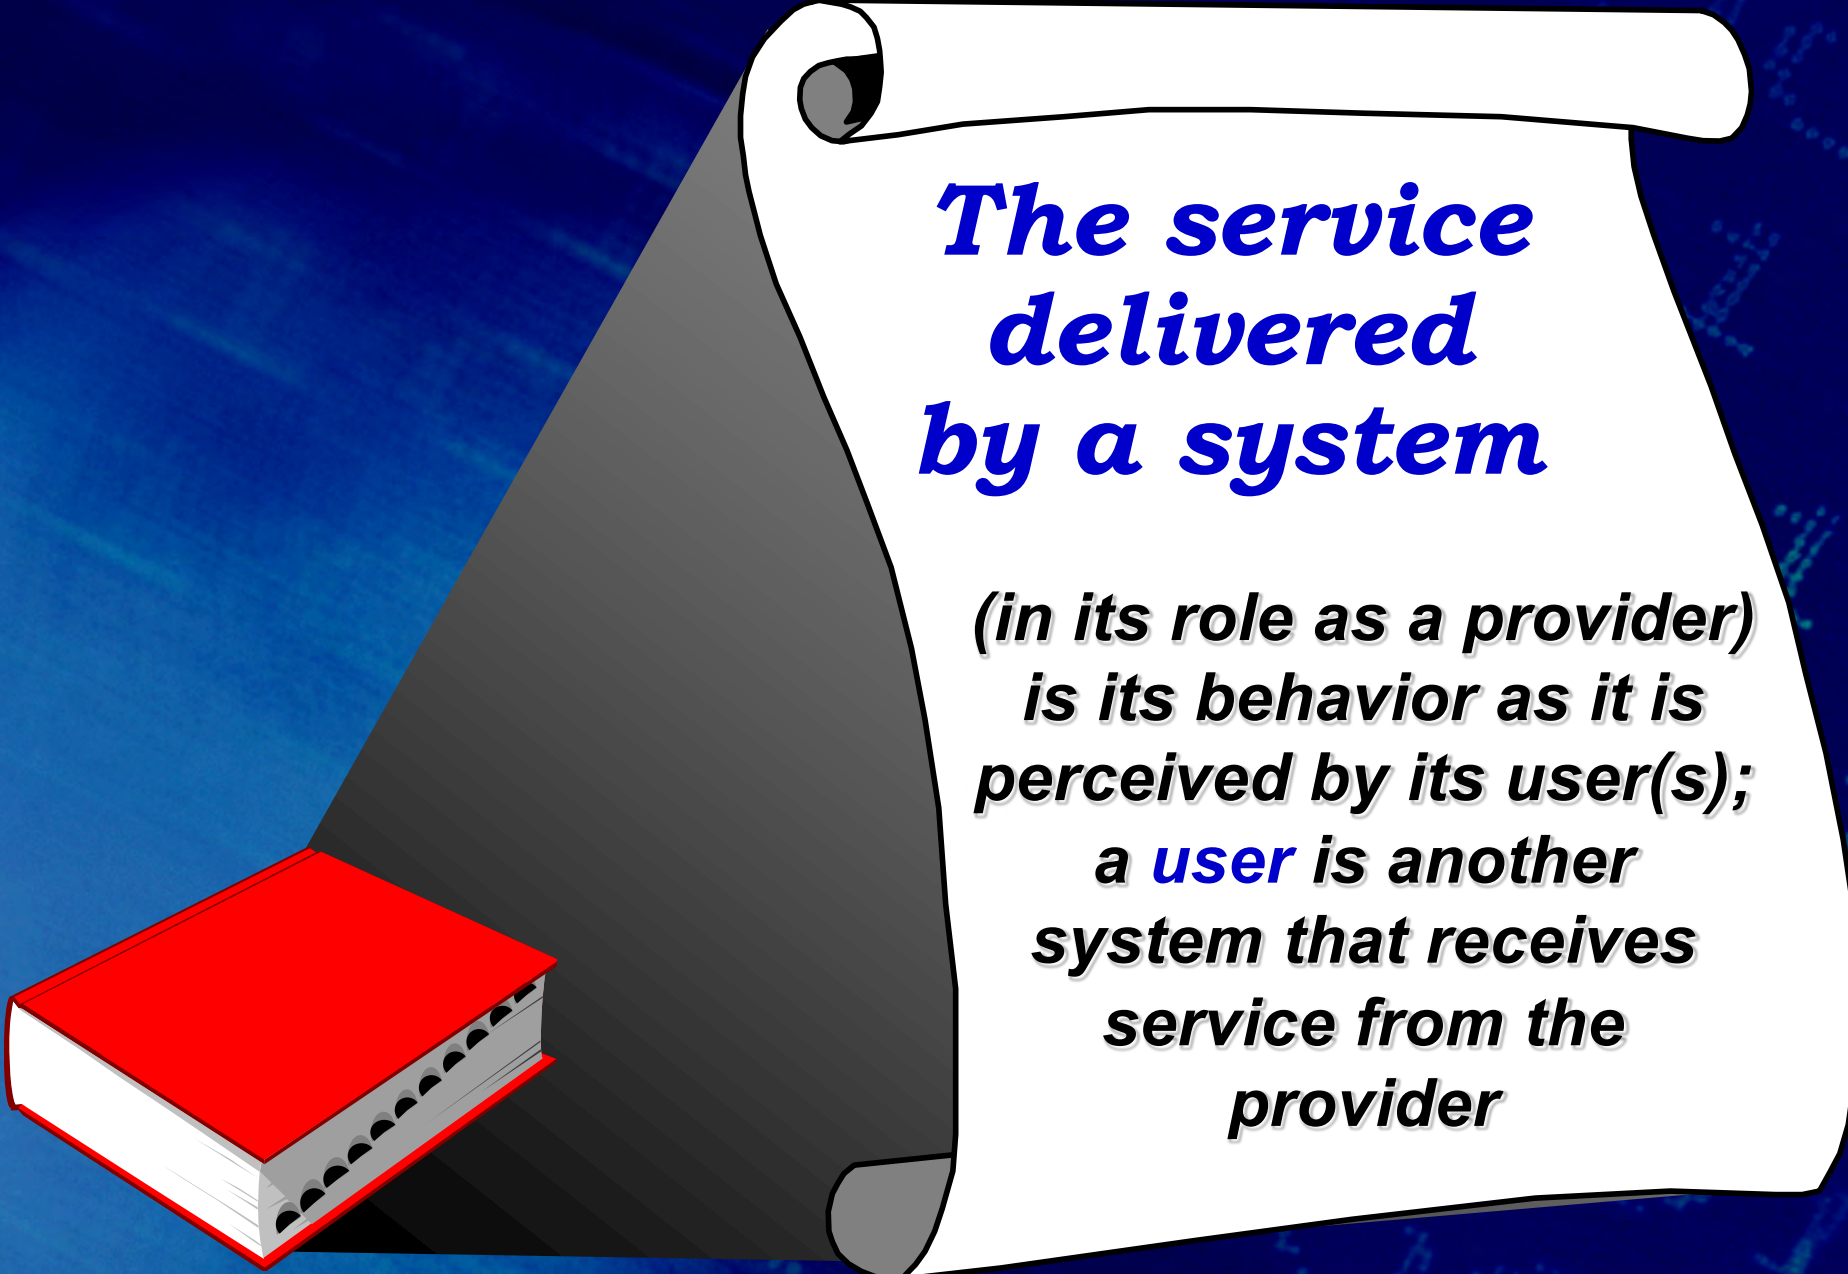

An entity that interacts with other entities, i.e., other systems, including hardware, software, humans, and the physical world with its natural phenomena

These other systems
are the **environment**
of the given system

System

**An entity that
interacts with other
entities, i.e., other
systems, including
hardware, software,
humans, and the
physical world with
its natural
phenomena**

The service delivered by a system

***(in its role as a provider)
is its behavior as it is
perceived by its user(s);
a **user** is another
system that receives
service from the
provider***

Correct service

***Correct service is
delivered when the
service implements
the system function***

Managing complexity

To manage complexity, the key method is to describe the system resorting to several ***levels of abstraction***

Abstraction

An abstraction is a simplified model of the system, showing only the selected features and ignoring the associated details

Top-down vs. Bottom-up

- **Top-down and bottom-up are both strategies of information processing and knowledge ordering, used in a variety of fields including software, humanistic and scientific theories, and management and organization.**
- **In practice, they can be seen as a style of thinking, teaching, or leadership**

Top-down

- **Proceeding by breaking large general aspects (as of a problem) into smaller more detailed constituents: working from the general to the specific**

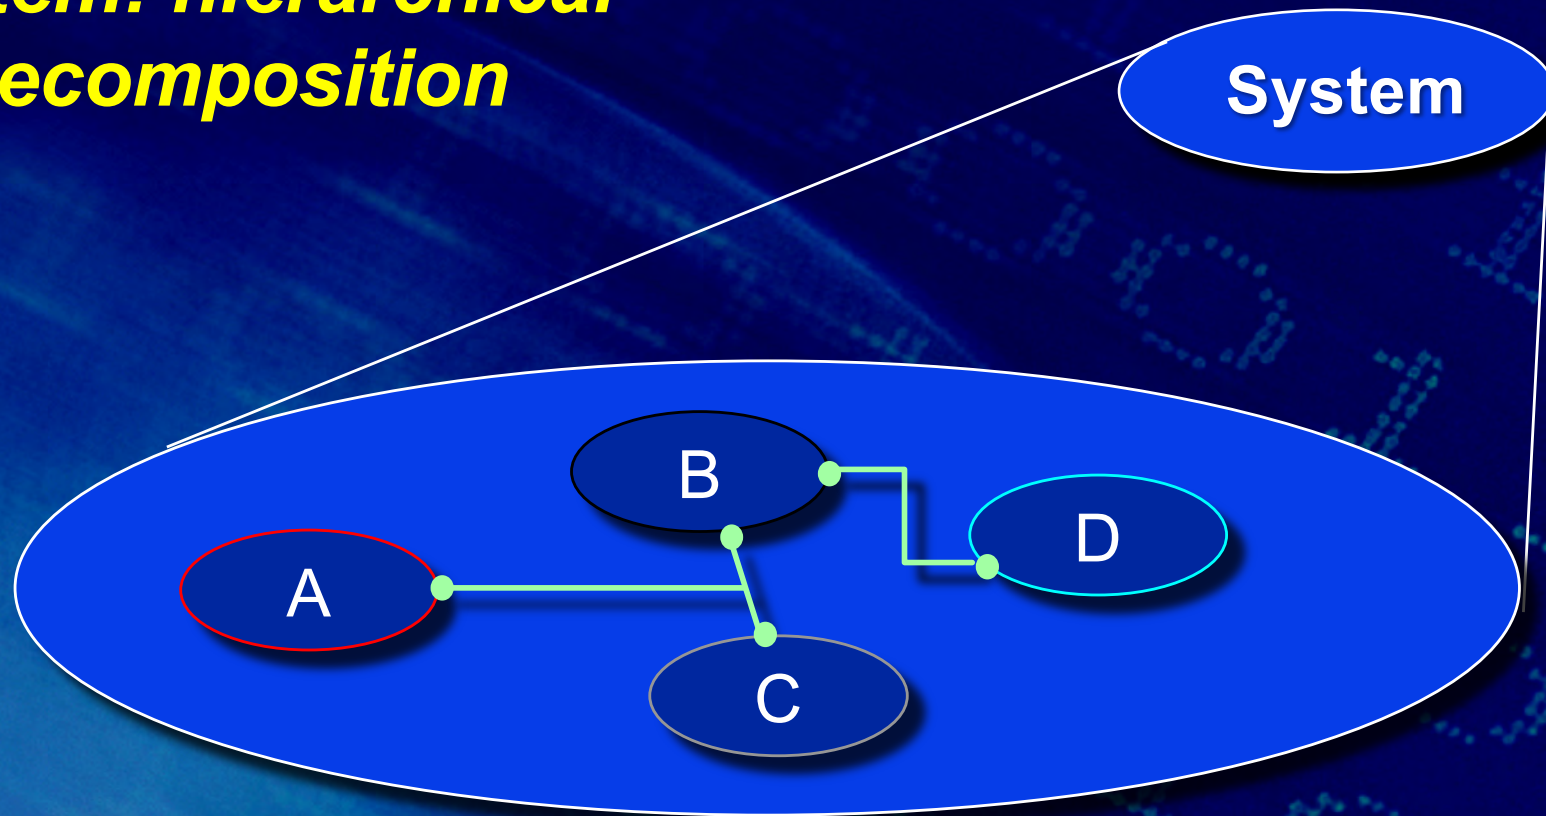

From High to Low

- **A high-level abstraction contains only the most vital data**
- **A low-level abstraction is more detailed and takes account of previously ignored information**
- **Although it is more complex, a low-level abstraction model is more accurate and is closer to the actual system.**

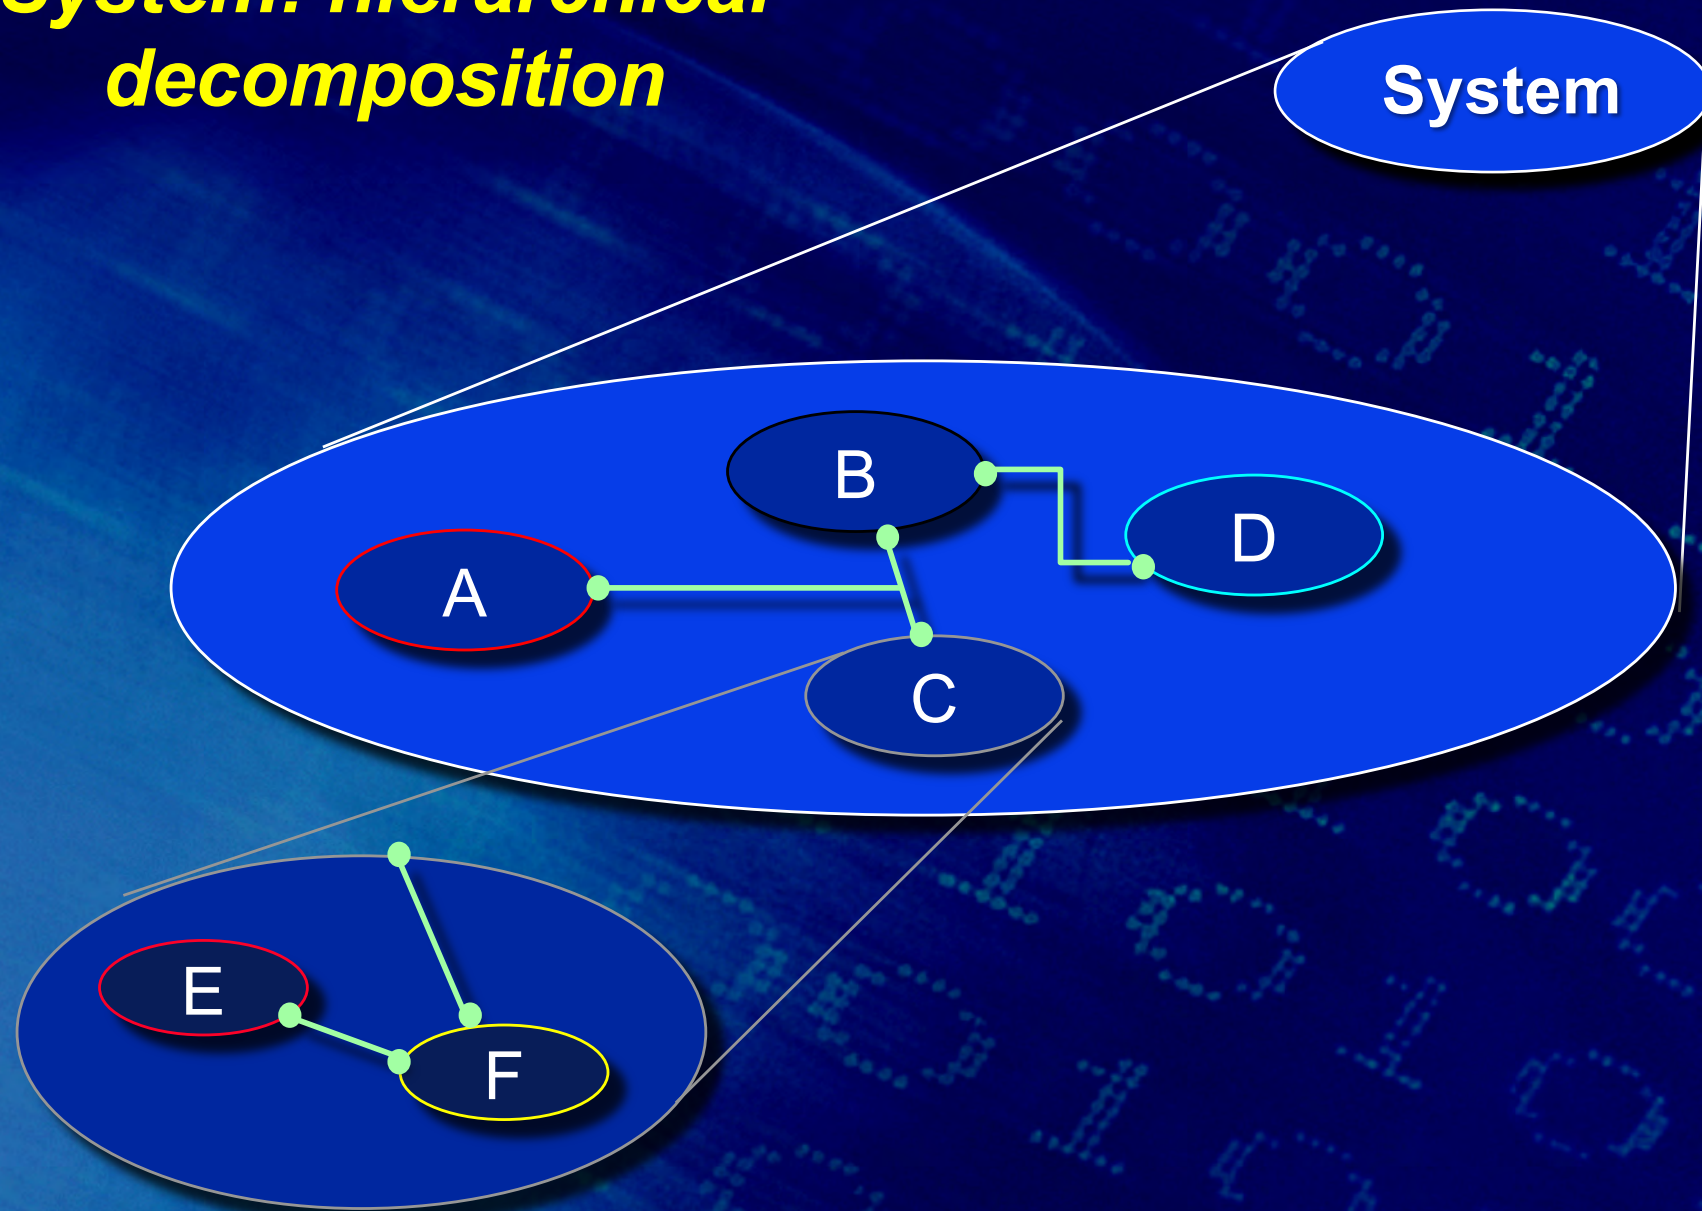

System: hierarchical decomposition

System

System: hierarchical decomposition

System: hierarchical decomposition

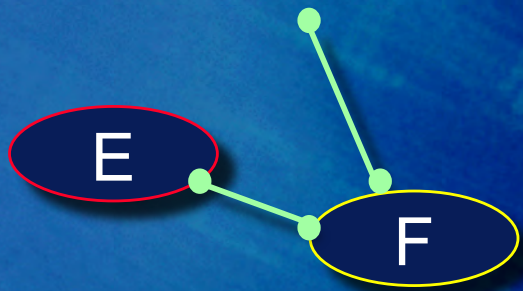

Bottom-up

- **Piecing together of systems to give rise to more complex systems, thus making the original systems sub-systems of the emergent system.**

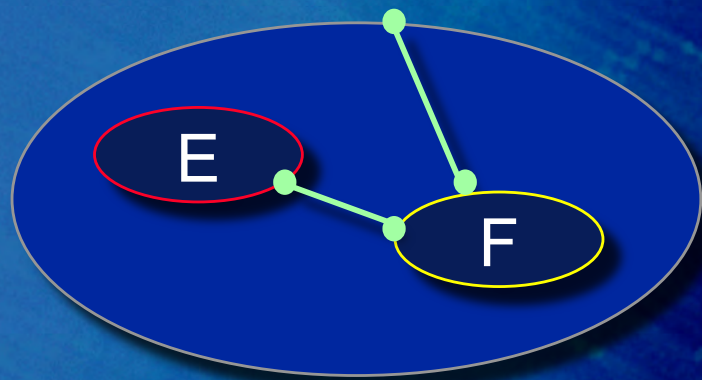

System: bittom-up composition

behavior

structure

physic

*Representation
domains*

*Abstraction
levels*

It describes
the **structure**
(i.e., the **topology**)
of the system,
in terms of a
set of blocks,
properly
interconnected

behavior structure physic *Representation
domains*

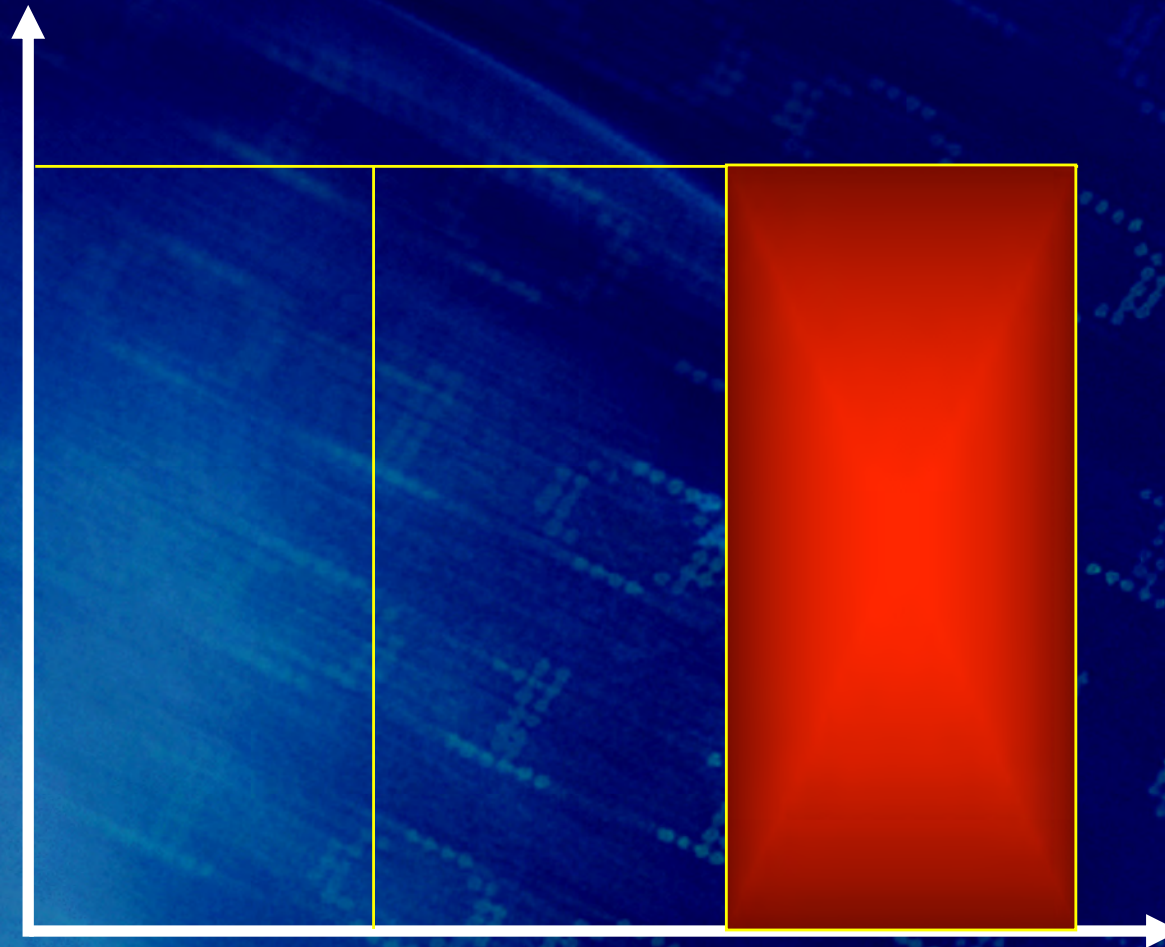

Abs

The description is
technology independent

It describes
the ***structure***
(i.e., the ***topology***)
of the system,
in terms of a
set of blocks,
properly
interconnected

behavior structure physic ***Representation domains***

behavior

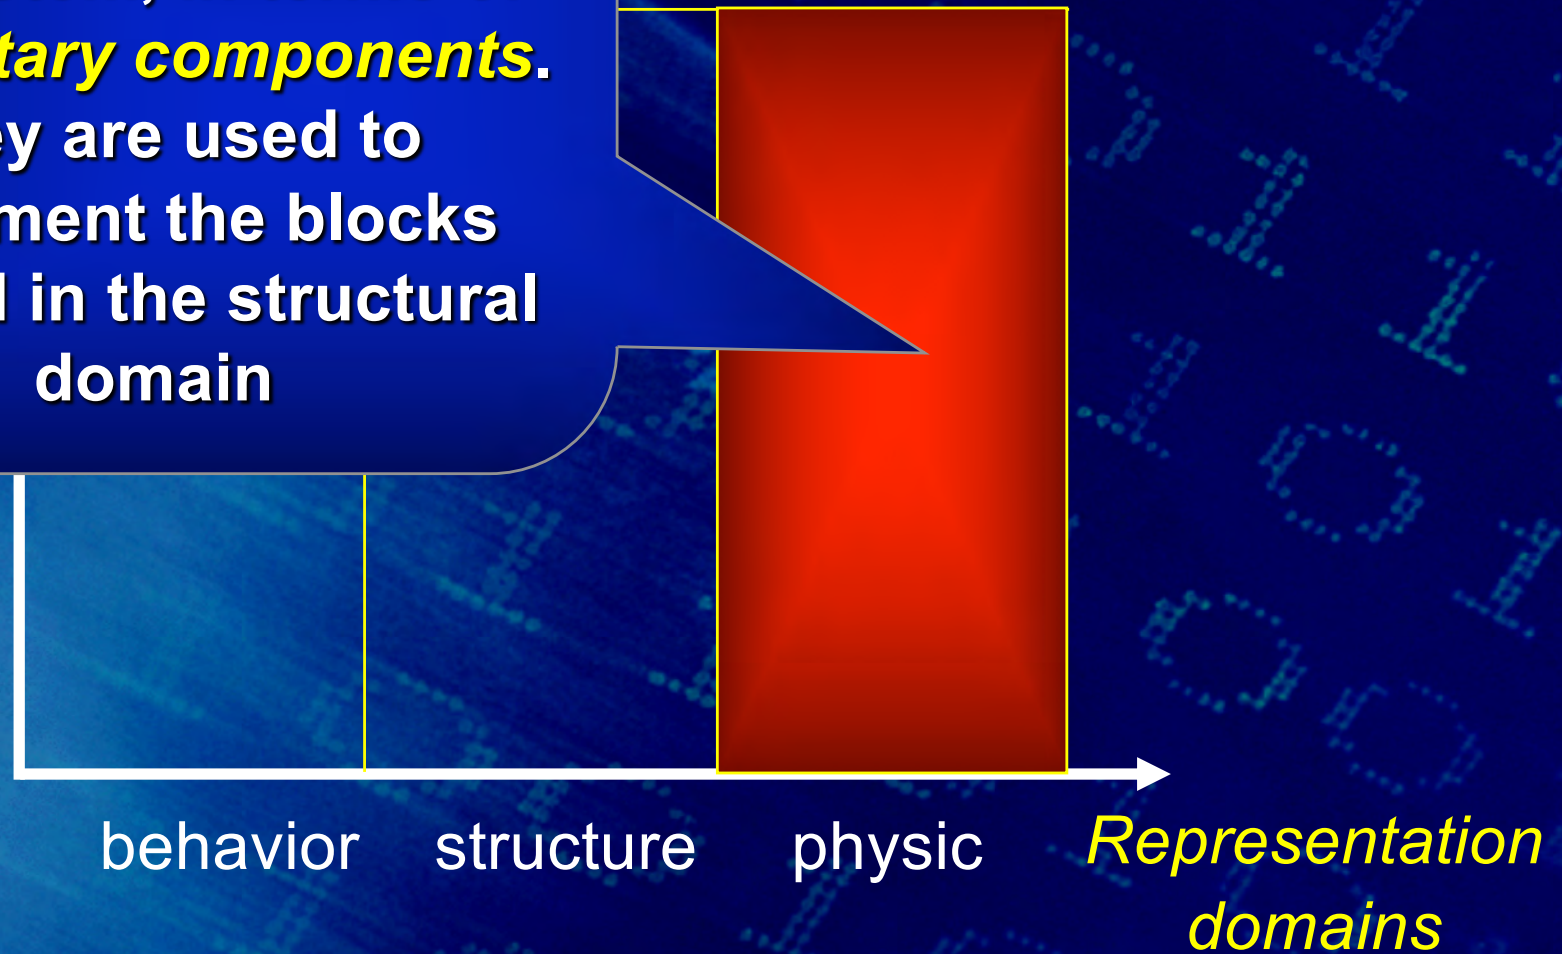

structure

physic

*Representation
domains*

AI It describes
the ***physical structure*** of
the system, in terms of
elementary components.

They are used to
implement the blocks
defined in the structural
domain

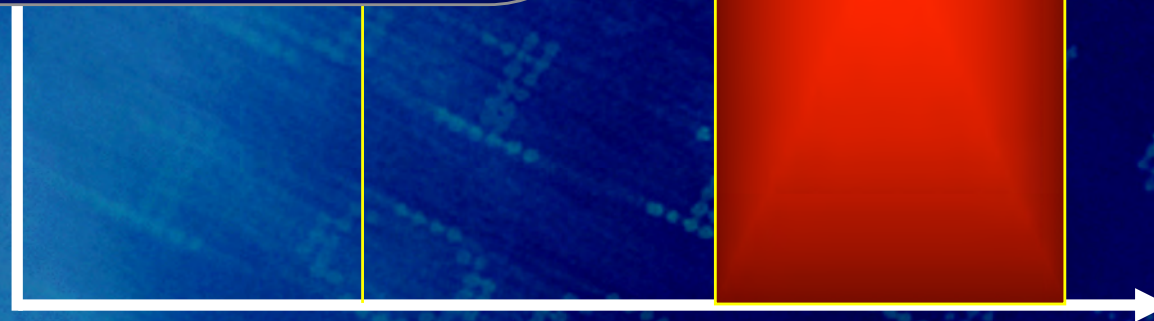

AI

It describes the **physical structure** of the system, in terms of **elementary components**.

They are used to implement the blocks defined in the structural domain

The description is **technology dependent**

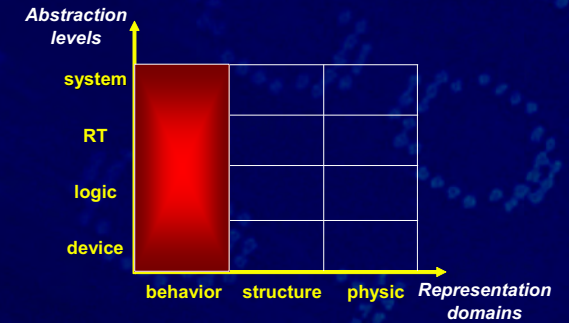

behavior

structure

physic

Representation domains

Behavioral domain

- Systems utility is determined by its **functional** as well as its **non-functional** properties

Functional Property

A property that specifies:

- ***the inputs (stimuli) to the system***
- ***the outputs (responses) from the system***
- ***the behavioral relationships between them***

Non-Functional Property

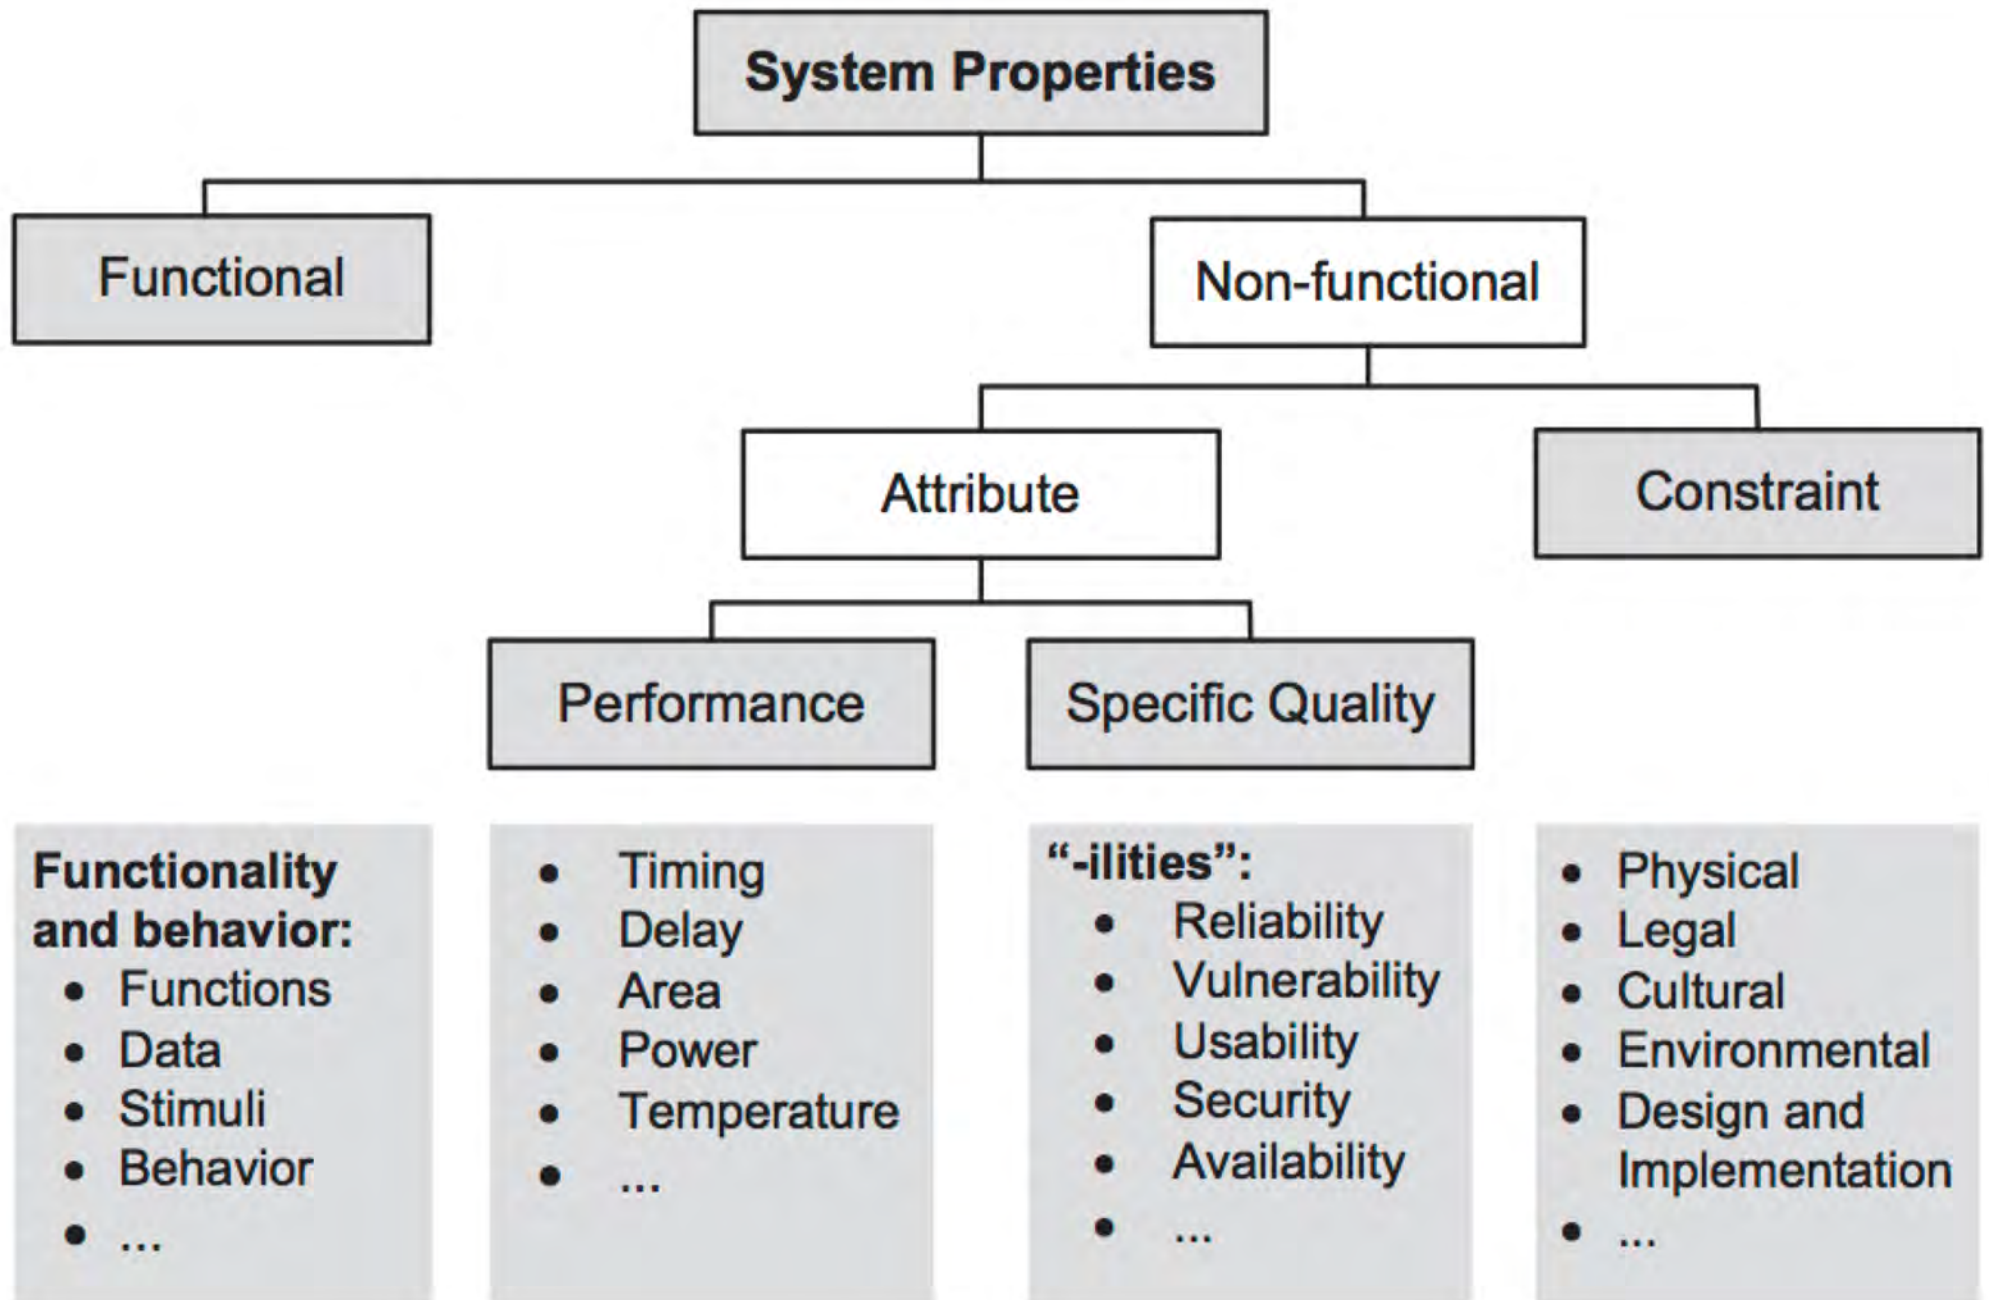

***An attribute or a
constraint on the
system***

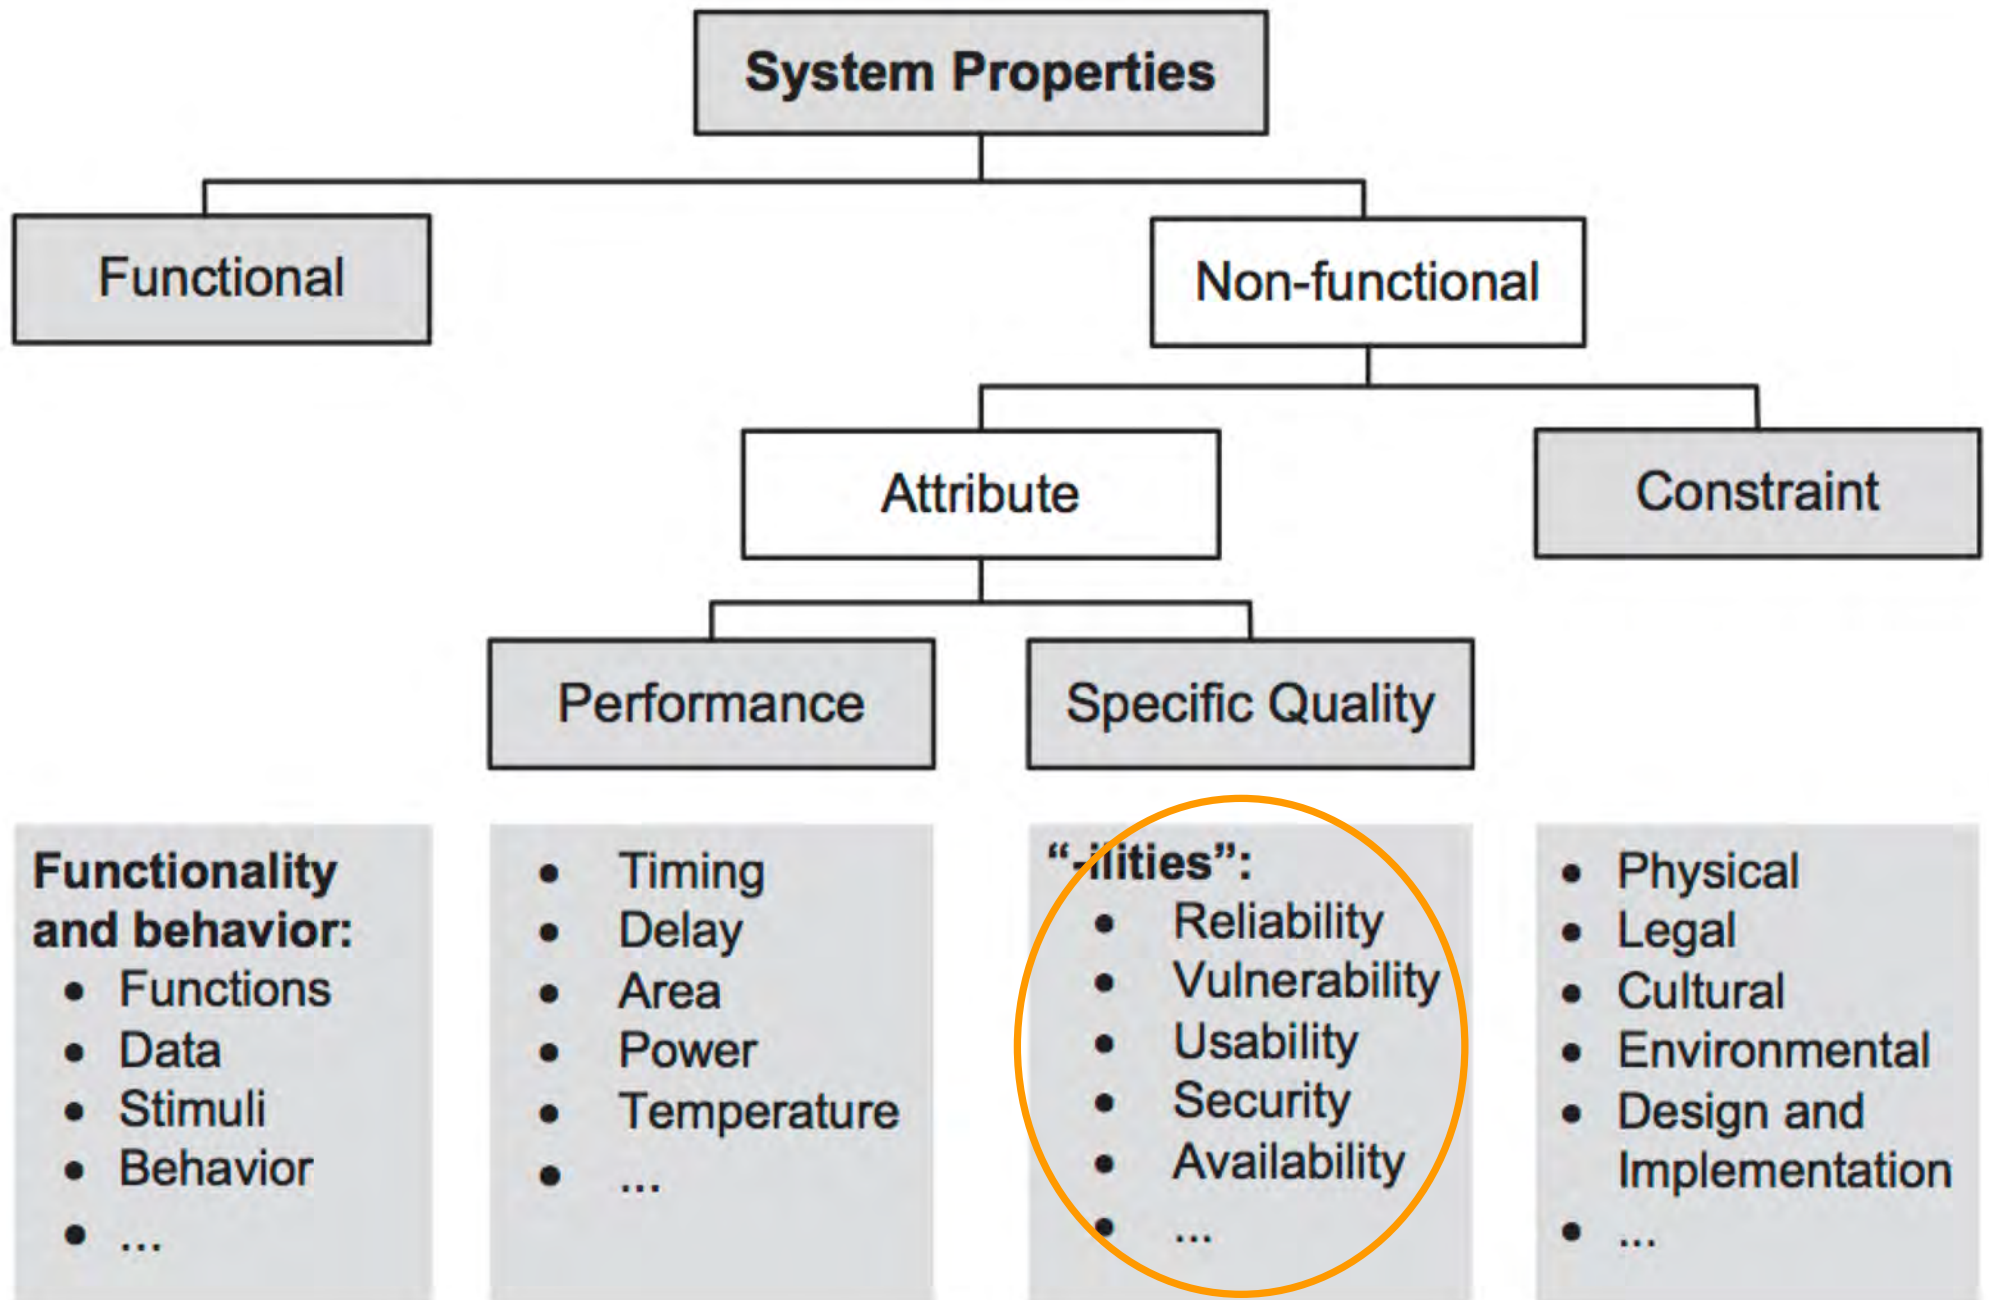

Attribute

***A performance
specification or a
specific quality of the
system***

A taxonomy of system properties

A taxonomy of system properties

Dependability

***Property of a system
that allows reliance to
be placed justifiably
on service it delivers***

Dependability

***The ability to deliver
service that can
justifiably be trusted***

Dependability

***The quality of the
“delivered service”
such that “reliance”
can justifiably be
placed on this
service.***

<i>Parameter</i>	<i>Consumer</i>	<i>Industrial</i>	<i>Automotive</i>
<i>temperature</i>	0°C → 40°C	-10°C → 70°C	-40°C → 85/155°C
<i>operation time</i>	1-3 years	5-10 years	up to 15 years
<i>humidity</i>	low	environment	0% up to 100%
<i>tolerated field failure rates</i>	< 10%	<< 1%	zero failure
<i>documentation</i>	none	conditional	true
<i>supply</i>	none	up to 5 years	up to 30 years

Safety

***The condition of
being protected from
or unlikely to cause
danger, risk, or injury***

Security

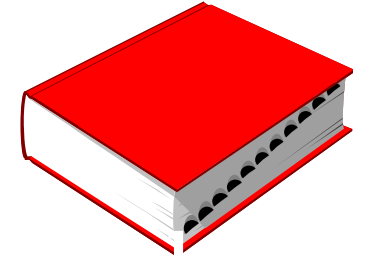

***The state of being
free from danger or
threat***

Security

***It provides
“a form of protection
where a separation is
created between the
assets and the threat”***

Computer security

53

- Measures and controls that ensure *confidentiality*, *integrity*, and *availability* of information system assets including hardware, software, firmware, and information being processed, stored, and communicated
